

Two recurring obstacles in the claim question

Coverage

full deviation class

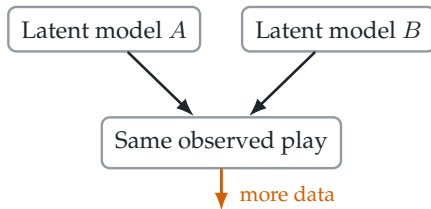

A deviation found
in the searched class
refutes the candidate.

None found $\Rightarrow$ a theorem or
bound must cover the rest.

*Search can expand coverage; a
bound can close the remainder.*

Identification

More of the same data
cannot tell A from B.

Needs new variation,
intervention, or an
added assumption.

*Observational equivalence
persists within the same regime.*
